

PECO AND ITS VARIATIONS

PECO is a variant of PICO which looks at Exposure instead of Intervention. It is also used in formulating clinical questions.

P opulation	<ul style="list-style-type: none"> How is your population defined? (e.g. age, gender, ethnic group ...)
E xposure	<ul style="list-style-type: none"> What has your population been deliberately or inadvertently exposed to?
C omparison	<ul style="list-style-type: none"> What are you comparing this with, e.g. a different level of exposure? (It's ok to leave this one blank if you are not doing a comparison)
O utcome(s)	<ul style="list-style-type: none"> Which result(s) are you focusing on or measuring? What are you hoping to improve?

Other variables that can be added to this PECO framework are:

D uration	<ul style="list-style-type: none"> What is the follow up schedule?
T imeframe	<ul style="list-style-type: none"> What is the duration of the exposure? What is the follow up schedule? Is this a longitudinal study?
R esults	<ul style="list-style-type: none"> Which reported results are you looking for in the literature on your topic?

Variant frameworks:

- PECODR = **P**opulation, **E**xposure, **C**omparison, **O**utcome, **D**uration, **R**esults
- PECOT = **P**opulation, **E**xposure, **C**omparison, **O**utcome, **T**imeframe
- PEO = **P**opulation, **E**xposure, **O**utcome

S etting	<ul style="list-style-type: none"> Where is your intervention of interest taking place?
C ontext	<ul style="list-style-type: none"> Where is this happening? (e.g. geographical location or service location) What is the social or cultural context for your population?

Variant frameworks:

- PICOC = **P**opulation, **I**ntervention, **C**omparison, **O**utcome, **C**ontext
- PICOS = **P**opulation, **I**ntervention, **C**omparison, **O**utcome, **S**tudy type
- PICOT = **P**opulation, **I**ntervention, **C**omparison, **O**utcome, **T**ime
- PICOTS = **P**opulation, **I**ntervention, **C**omparison, **O**utcome, **T**iming, **S**etting
- PICOTT = **P**opulation, **I**ntervention, **C**omparison, **O**utcome, **T**ype of question, **T**ype of study
- PIO = **P**opulation, **I**ntervention, **O**utcome

The **PICo** variation is useful for qualitative studies.

P opulation or Problem	<ul style="list-style-type: none"> How is your population defined? (e.g. age, gender, ethnic group ...) Which of their problems, diseases or conditions are you looking at
I nterest	<ul style="list-style-type: none"> Which experience, activity, process or event are you interesting in focusing on?
C ontext	<ul style="list-style-type: none"> Where is this happening? (Geographical location, e.g. Australia / Service location, e.g. hospital)

This variation of **PICO** is used for evaluating diagnostic tests.

P atient or Participants or Population	<ul style="list-style-type: none"> How is your population defined? (e.g. age, gender, ethnic group ...) Which of their problems, diseases or conditions are you looking at
I ndex tests	<ul style="list-style-type: none"> Which test are you evaluating?
C omparator or reference tests	<ul style="list-style-type: none"> Which alternative are you comparing this with? (It's ok to leave this one blank if you are not doing a comparison)
O utcome	<ul style="list-style-type: none"> Which result are you focusing on or measuring? What are you hoping to improve?
